

# Relation between Dirichlet kernels with respect to Vilenkin-like systems

ISTVÁN BLAHOTA\*

**Abstract.** In this paper we discuss the relation between Dirichlet-kernels with respect to Vilenkin and Vilenkin-like systems. This relation gives a useful tool in field of approximation theory on compact totally disconnected Abelian groups.

## Introduction

Let  $m := (m_0, m_1, \dots)$  denote a sequence of positive integers not less than 2. Denote by  $Z_{m_j} := \{0, 1, \dots, m_j - 1\}$  the additive group of integers modulo  $m_j$  ( $j \in \mathbf{N}$ ). Define the group  $G_m$  as the cartesian product of the discrete cyclic groups  $Z_{m_j}$ ,

$$G_m := \prod_{j=0}^{\infty} Z_{m_j}.$$

The elements of  $G_m$  can be represented by sequences  $x := (x_0, x_1, \dots, x_j, \dots)$  ( $x_j \in Z_{m_j}$ ). It is easy to give a base the neighborhoods of  $G_m$ :

$$I_0(x) := G_m,$$

$$I_n(x) := \{y \in G_m \mid y_0 := x_0, \dots, y_{n-1} := x_{n-1}\}$$

for  $x \in G_m, n \in \mathbf{N}, k = 0, 1, \dots, m_n - 1$ . Define  $I_n := I_n(0)$  for  $n \in \mathbf{P}$  ( $\mathbf{P} := \mathbf{N} \setminus \{0\}$ ). Then  $I_n$  is a subgroup of  $G_m$  ( $n \in \mathbf{N}$ ). The direct product  of the measures

$$\mu_k(\{j\}) := \frac{1}{m_k} \quad (j \in Z_{m_k}, k \in \mathbf{N})$$

is the Haar measure on  $G_m$  with  $\mu(G_m) = 1$ .

If  $M_0 := 1, M_{k+1} := m_k M_k (k \in \mathbf{N})$ , then every  $n \in \mathbf{N}$  can be uniquely expressed as  $n = \sum_{j=0}^{\infty} n_j M_j$ , where  $n_j \in Z_{m_j} (j \in \mathbf{N})$  and only a finite number of  $n_j$ 's differ from zero.

Define on  $G_m$  the *generalized Rademacher functions* in the following way:

$$r_k(x) := \exp \frac{2\pi i x_k}{m_k} \quad i^2 := x \in G_m, \quad k \in \mathbf{N}.$$

It is known that the functions

$$\psi_n(x) := \prod_{k=0}^{\infty} r_k^{n_k}(x) \quad (n \in \mathbf{N})$$

on  $G_m$  are elements of the character group of  $G_m$ , and all the elements of the character group are of this form. If  $x, y \in G_m, n, m \in \mathbf{N}$  then it is easy to see that

$$\psi_n(x + y) = \psi_n(x) \psi_n(y),$$

and

$$\psi_{n+m}(x) = \psi_n(x) \psi_m(x).$$

The system  $(\psi_n | n \in \mathbf{N})$  is called a *Vilenkin system* and  $G_m$  a *Vilenkin group*.

The Dirichlet kernels are

$$D_n^\psi(x) := \sum_{k=0}^{n-1} \psi_k(x) \quad (n \in \mathbf{N})$$

with respect to the Vilenkin system for which it is known (see [4]) that:

**Theorem A.**

$$D_{M_n}^\psi(x) = \begin{cases} M_n, & x \in I_n \\ 0, & x \notin I_n \end{cases} \quad (n \in \mathbf{N}).$$

Let  $\mathcal{A}_n$  be the  $\sigma$ -algebra generated by cosets  $I_n(z)$ , where  $(n \in \mathbf{N})(z \in G_m)$ . Let  $\alpha_j^k, \alpha_n(k, j, n \in \mathbf{N})$  be functions satisfying the following conditions:

- (i)  $\alpha_j^k : G_m \rightarrow \mathbf{Cis} \mathcal{A}_j$  - measurable  $(k, j \in \mathbf{N})$ ,
- (ii)  $|\alpha_j^k| := \alpha_0^k := \alpha_j^0 := \alpha_j^k(0) := 1 (k, j \in \mathbf{N})$
- (iii)  $\alpha_n := \prod_{j=0}^{\infty} \alpha_j^{j(n)} (n \in \mathbf{N}, j(n) := \sum_{k=j}^{\infty} n_k M_k)$ .

Let  $\chi_n := \psi_n \alpha_n$  ( $n \in \mathbf{N}$ ). A function system  $\{\chi_n | n \in \mathbf{N}\}$  of this type is called a  $\psi\alpha$  (*Vilenkin-like*) system on Vilenkin group  $G_m$ .

The  $\psi$  and  $\psi\alpha$  systems are orthonormal and complete in  $L^1(G_m)$ .

The Dirichlet kernels with respect to  $\psi\alpha$  system are

$$D_n^\chi(x, y) := \sum_{k=0}^{n-1} \chi_k(x) \overline{\chi_k(y)} \quad (n \in \mathbf{N})$$

The subsequence  $D_{M_n}^\chi$  has a closed form

$$D_{M_n}^\chi(x, y) = \begin{cases} M_n, & x - y \in I_n \\ 0, & x - y \notin I_n \end{cases} \quad (n \in \mathbf{N}),$$

(see [2]). We will use the following theorem, too (see [1]):

**Theorem B.**

$$D_{jM_t}^\chi(x, y) = \alpha_{jM_t}(x) \overline{\alpha_{jM_t}(y)} D_{jM_t}^\psi(x - y) \quad (n \in \mathbf{N}, x, y \in G_m).$$

**Lemma.** Let  $x \in G_m$ ,  $j, t \in \mathbf{N}$ . Then  $D_{jM_t}^\psi(x) = D_{M_t}^\psi(x) \sum_{k=0}^{j-1} \psi_{kM_t}(x)$ .

This lemma is needed in the proof of the theorem.

**Theorem** Let  $x, y \in G_m, n \in \mathbf{N}$ . Then

$$D_n^\chi(x, y) = D_n^\psi(x - y)$$

holds if and only if  $n \in \{jM_t | 0 \leq j < m_t; t, j \in \mathbf{N}\}$ .

**PROOF** of the lemma. Using the statements and theorems mentioned above we have the following equations:

$$\begin{aligned} D_{jM_t}^\psi(x) &= \sum_{l=0}^{jM_t-1} \psi_l(x) = \sum_{h=0}^{j-1} \left( \sum_{l=hM_t}^{(h+1)M_t-1} \psi_l(x) \right) = \\ &= \sum_{h=0}^{j-1} \left( \sum_{l=hM_t}^{(h+1)M_t-1} \psi_{l_0M_0+\dots+l_{t-1}M_{t-1}+hM_t}(x) \right) = \\ &= \sum_{h=0}^{j-1} \left( \sum_{l=hM_t}^{(h+1)M_t-1} \psi_{l_0M_0}(x) \cdots \psi_{l_{t-1}M_{t-1}}(x) \psi_{hM_t}(x) \right) = \end{aligned}$$

$$\begin{aligned}
& \sum_{h=0}^{j-1} \sum_{l_{t-1}=0}^{m_t-1} \cdots \sum_{l_0=0}^{m_0-1} \psi_{l_0 M_0}(x) \cdots \psi_{l_{t-1} M_{t-1}}(x) \psi_{h M_t}(x) = \\
& \sum_{h=0}^{j-1} \psi_{h M_t}(x) \sum_{l_{t-1}=0}^{m_t-1} \psi_{l_{t-1} M_{t-1}}(x) \cdots \sum_{l_0=0}^{m_0-1} \psi_{l_0 M_0}(x) = \\
& \left( \sum_{h=0}^{j-1} \psi_{h M_t}(x) \right) \prod_{k=0}^{t-1} \sum_{l_k=0}^{m_k-1} \psi_{l_k M_k}(x) = \\
& \left( \sum_{h=0}^{j-1} \psi_{h M_t}(x) \right) \sum_{l_{t-1}=0}^{m_t-1} \psi_{l_{t-1} M_{t-1}}(x) \cdots \sum_{l_0=0}^{m_0-1} \psi_{l_0 M_0}(x) = \\
& \left( \sum_{h=0}^{j-1} \psi_{h M_t}(x) \right) \sum_{l_{t-1}=0}^{m_t-1} \cdots \sum_{l_0=0}^{m_0-1} \psi_{l_0 M_0}(x) \cdots \psi_{l_{t-1} M_{t-1}}(x) = \\
& \left( \sum_{h=0}^{j-1} \psi_{h M_t}(x) \right) \sum_{l_{t-1}=0}^{m_t-1} \cdots \sum_{l_0=0}^{m_0-1} \psi_{l_0 M_0 + \cdots + l_{t-1} M_{t-1}}(x) = \\
& \left( \sum_{h=0}^{j-1} \psi_{h M_t}(x) \right) \sum_{l=0}^{M_t-1} \psi_l(x) = D_{M_t}^\psi(x) \sum_{k=0}^{j-1} \psi_{k M_t}(x).
\end{aligned}$$

This completes the proof of the Lemma.

**PROOF of the theorem** The form  $n = j M_t$  is not unique. (For example  $j M_{t+1} = (j m_t) M_t$ .) In our presentation let  $n = j M_t$  be that expression, in which  $j$  is the least.

1. *Sufficiency.* Suppose that  $n \in \{j M_t | t, j \in \mathbf{N}; 0 \leq j < m_t\}$ , and  $x, y \in G_m$ .

1.1. Let  $x - y \notin I_t$ . In this case by the theorem A. we have  $D_{M_t}^\psi(x - y) = 0$ . By lemma  $D_{j M_t}^\psi(x - y) = 0$ . The theorem B. shows that

$$D_{j M_t}^\times(x, y) = \alpha_{j M_t}(x) \bar{\alpha}_{j M_t}(y) D_{j M_t}^\psi(x - y).$$

So  $D_{j M_t}^\times(x, y) = 0$ , too. Consequently if  $x - y \notin I_t, t, j \in \mathbf{N}$ , then

$$D_{j M_t}^\times(x, y) = D_{j M_t}^\psi(x - y) = 0.$$

1.2. Let  $x - y \in I_t, t, j \in \mathbf{N}, 0 \leq j < m_t$ . Then  $x_0 - y_0 = 0, \dots, x_{t-1} - y_{t-1} = 0$ ,

$$\begin{aligned} \alpha_{jM_t}(x) \overline{\alpha}_{jM_t}(y) &= \\ \alpha_1^{1(jM_t)}(x_0, n_1, \dots, n_{t-1}, n_t, n_{t+1}, \dots) \cdots \\ \alpha_t^{t(jM_t)}(x_0, x_1, \dots, x_{t-1}, n_t, n_{t+1}, \dots) \\ \overline{\alpha}_1^{1(jM_t)}(x_0, n_1, \dots, n_{t-1}, n_t, n_{t+1}, \dots) \cdots \\ \overline{\alpha}_t^{t(jM_t)}(x_0, x_1, \dots, x_{t-1}, n_t, n_{t+1}, \dots) &= \\ \alpha_{jM_t}(x) \overline{\alpha}_{jM_t}(x) &= |\alpha_{jM_t}(x)| = 1. \end{aligned}$$

If  $x - y \in I_t, t, j \in \mathbf{N}, 0 \leq j < m_t$ , then

$$D_{jM_t}^X(x, y) = D_{jM_t}^\psi(x - y).$$

This completes the proof of the first part of the theorem.

2. *Necessity.* If  $n = \sum_{k=0}^s n_k M_k$ , then let

$$\alpha_k^{k(n)}(x_0, \dots, x_{k-1}, n_k, \dots, n_s) := \begin{cases} \exp(i) & \text{if } x_0 \dots x_{k-1} \neq 0 \text{ and } k \leq s \\ 1 & \text{else.} \end{cases}$$

In this case does not exist such  $j \in \mathbf{P}$  that  $\alpha_j(x) = 1$ .

2.1. Now we suppose that  $n \notin \{jM_h | h, j \in \mathbf{N}\}$ . Let  $t$  be defined in the following way

$$t := \min\{k | n < M_k; k, n \in \mathbf{N}\}.$$

Let  $x' := (0, 0, \dots, 0, x_t := 1, 0, \dots), t \in \mathbf{N}$  and  $y' := (0, 0, 0, \dots)$ . In this case

$$D_n^X(x', y') = \sum_{k=0}^{n-1} \chi_k(x') =$$

$$c \sum_{k=0}^{n-1} \psi_k(x') = c \sum_{k=0}^{n-1} \psi_k(x' - y') = c D_n^\psi(x' - y'),$$

where  $c \neq 1$ . We prove that  $D_n^\psi(x' - y') \neq 0$ , thus in this case  $D_n^\psi(x' - y') \neq D_n^X(x', y')$ . But

$$D_n^\psi(x' - y') = \sum_{k=0}^{n-1} \exp\left(\frac{2\pi i k t}{m_t}\right) = \sum_{k=0}^{n-1} \exp\left(\frac{2\pi i O}{m_t}\right) = n \neq 0.$$

2.2 Let  $n \in \{jM_t | t, j \in \mathbf{N}, m_t < j\}$ . It is easy to see that  $x' - y' \in I_t$ , but  $x' - y' \notin I_{t+1}$ . Then

$$D_{jM_t}^x(x', y') = cD_{jM_t}^\psi(x' - y'),$$

where  $c \neq 1$ . We will prove that  $D_{jM_t}^\psi(x' - y') \neq 0$ , thus

$$D_{jM_t}^x(x', y') \neq D_{jM_t}^\psi(x' - y').$$

We have by lemma

$$D_{jM_t}^\psi(x' - y') = D_{M_t}^\psi(x' - y') \sum_{k=0}^{j-1} \psi_{kM_t}(x' - y') = M_t \sum_{k=0}^{j-1} \psi_{kM_t}(x' - y') =$$

$$M_t \sum_{k=0}^{j-1} \exp\left(\frac{2\pi i}{m_t}\right)^2 = M_t \frac{1 - \exp\left(\frac{2\pi i}{m_t}\right)^2}{1 - \exp\left(\frac{2\pi i}{m_t}\right)} \neq 0,$$

since  $m_t \nmid j$ .

The proof of theorem is complete.
